

Databases

Databases are useful for sharing information between servers, If you are trying to run a Minecraft network, you will most likely be using them for plugins like, Luckperms, or any plugins you want to share between.

Using the databases is simple, Depending on how many available databases you have to your server, the panel will prompt you to create a new database, All you have to do is type a name, And (advanced) choose which ip's/domains are allowed to connect to it

Once your database has been created. it will bring you to your list of active databases created by you/your server

On this list you will see the:

- database name
- database connection address
- Username.

To view your password, please click the eye icon on the right side of the database list

Also upon clicking the eye icon, you will see a "JDBC CONNECTION STRING" Most plugins that use a MySQL database will use this connection string, Though make sure you double check if you copy and paste for simplicity
